How To Work On Project Files

Install Software

- Node.js - Both versions work. I downloaded 'Current'.
- Follow the download instructions until a checkbox asks if you want to download dependencies with Chocolatey. Check that box.
- Once node.js is installed, install VS Code if you have not already
  - VS Code, not Visual Studio(Blue logo, not purple)

How To Open & Edit Files On Your Computer(Git Bash)

- Open Git Bash
- Follow these commands to open up the project files in VS Code
  - cd CSI-280-Project/volunteer-web/
  - code .
- This should open up VS Code, and you can now edit the project files!

How To Display The Site On Your Computer

- Ctrl + j - opens terminal
- Type 'npm run dev' + enter to start the local server hosting your site
  - If 'npm run dev' does not work, you most likely don't have Vite installed. To fix this, type 'npm install vite@latest' or 'npm install'
  - Both methods worked; the latter installs a lot more than the first but is more certain to work if you don't know the issue or the first doesn't work
- Type 'o' + enter to host the site locally and display it on your browser
- The site should be up and running on your computer for you to test accordingly!
